

For the final week of my project, I fixed some errors and added a few details to my pages:

- I followed the Professor's instructions on fixing the error on my train.html file: The scrolling effect on the train station page doesn't work if the screen's width is small. The code worked, and all my elements were displayed on small screens (thank you!). However, the scrolling effect was still not working. This led me to think that the problem doesn't lie in the displaying part but in the effect part. So, I went back to train.js, studied it, and found the error. I forgot that the values in line 48 are just placeholder values. So, for the properties in lines 44-46, I had to change the min-width to 0 and scarto to 500. This has fixed all the errors.
- I added a sound button to cars.html using these two codes:
<https://codepen.io/dchan630/pen/VmBrGR>,
<https://codepen.io/androidcss/pen/yOopGp>.
- I added a skip animation button on the messages page by asking ChatGPT to write me the codes. The codes ChatGPT provided are very nice, I only had to make very small adjustments.
